MANUFACTURER INFORMATION

Agricultural Machinery

Fatih Mah. 1191 Sk. No: 17/A P.K.35414 Gaziemir - İZMİR - TÜRKİYE

Ph : +90.232 281 54 04 - 281 63 30 - 281 63 31 Fax: +90.232 281 57 10

www.minosagri.com - e-mail: info@minosagri.com - www.facebook.com/minosagri - www.twitter.com/turkaygrup

The machine is designed to harvest maize to obtain forage or to feed animals directly. It cuts and chops maize. Maize is cut by a pair of disc knives, next is passed on inlet rollers and is directed to a set of twelve chopping knives. Crumbled plants together with pressed air are directed by the channel to the trailer. A special ribbed bottom of the milling area causes crushing corns. It improves feeding value of the green forage. Steering of the blown up forage stream is carried out from the tractor cabine. The harvester is suspended on the three point link of the tractor and the trailer is connected to the hook of the harvester.

To get the best result from silage the maize harvester has to chop stems and crops perfectly. Maize harvester's feeding system is designed to feed the cutting discs at right angles for the best quality silage. The cutting disc is equipped with 12 specially hardened knives. There are two feeder drums and two drums-roller that control the feeding of the maize to the disc.

- Never carry anyone or any animal on the machine.
- Pay attention on the traffic rules on public roads.
- Check out the lightening, warning decals, and protection guards before starting to work.
- Pay attention to work with the machine in the daylight. Especially at nights in public roads take care to have safety decal(light decal apparatus) on the machine

**ATTENTION!**

WHILE THE MACHINE IS CONNECTED TO THE TRACTOR AND IF THE TRACTOR IS IN WORKING POSITION.

Figure 1- Dimensions of the machine

l(length)	b(width)	h(height)
3450 mm	2370 mm	3090 mm

TRANSPORTING :

- Never carry anyone or any animal on the machine.
- Pay attention on the traffic rules on public roads.
- Check out the lightening, warning decals, and protection guards before starting to work.
- Pay attention to work with the machine in the daylight. Especially at nights in public roads take care to have safety decal(light decal apparatus) on the machine

Transporting the machine:**1.Transporting with forklift :**

You must choose a forklift according to the weight of the machine. Hold the machine from its weight center. Connect the forklift hook on the machine from the weight center. Start transporting the machine.

2.Transporting with crane:

This method is same as transporting with forklift. Hold the machine from its weight center by crane. Pay attention if the security lock of the crane's hook is working safely.

3.Transporting with palette:

Choose palette according to the machine dimensions. Transport the machine by forklift while it is on palette.

- Never be under the machine or near the machine while transporting it by forklift, crane or palette.

- Take care of the security of the hook and iron ropes.Be sure that they are full of security.

Figure 2- Transporting the machine by Forklift and Palette

ATTENTION!

PAY ATTENTION TO BE NOT UNDER THE MACHINE WHILE TRANSPORTING

A specially designed single line T-MSM Maize Chopper with gear box is an ideal machine for the small and medium size fields.

Main Holder:

The main holder is produced from a bended sheet material. The first and second gear box take place on main holder.

Also the three point hitch is connected to this holder by connection elements so the hitch can be shifted left and right.

Figure 3- Main parts of the machine

- | | |
|----------------------------|----------------------------------|
| 1.Main Holder | 4.Cutting Unit |
| 2.Three point hitch System | 5.Feeding unit |
| 3.Gear-box group | 6.Crop chute-Discharging shimney |

Three Point Hitch System:

It is produced from a square profile. The upper and lower connection parts that connects the machine to the tractor are produced from sheet material and welded on the profile. There are 2 connection elements that take place behind the lower connection part, and by this system the hitch can be shifted on the profile in the left and right direction. This elements are fixed with washer and fixing nuts.

Gear-Box Group

The rotation movement of the tractor power shaft of 540 rpm comes to the 1. gear box by the help of tractor shaft. This gear box which is placed on the hitch, moves together with the hitch when it is shifting left and right sides. The rotation movement is given to the second gear box by shaft by changing its direction to 90. Then the movement goes to the cutting disc by the help of the gear that is connected to the spindle of the second gear box.

Figure 4- 1.Gear-box

Figure 5-2
Gear Box

Cutting Disk and Cutting Operation

Cutting disc includes 12 knives, cutting elements and disc. The maize firstly laid down by the help of the wires on the feeding unit and the maize is taken inside of the feeding unit by the help of the cutting drums, and the drums cut the maize. Before cutting take care of to control the oil levels of the gear boxes.

Cutting Unit:

The two cutting drums are full of security against the overload.

Figure 6- Cutting Unit

•**Feeding Unit :** It has 1 feeding drum with gears and 1 feeding drum without gears.1

Figure 7- Connection to the tractor

Figure 7- Cutting drums-Feeding unit

Cutting Height Adjustment Unit: It adjusts the cutting height of the maize. This cutting height is adjusted by shifting the holes of the profile. Cutting disc must be 10 cm higher than the soil. Protection lid: This part is assembled to the main holder by connection elements and produced by sheet material. This prevents to give damage to the living beings by the cutting knives. •The movement is given by side shaft to the cutting knives of the machine. The material which is cut by the knives of the drums transfers to the cutting knives inside. The material which is crushed by the drums transferred to the crop chute than the silage crop is loaded to the romork which is connected to the machine. •There are two types of knives in the Maize Chopper. The first type of the knives of the drums cut the silage material in regular cutting height. If these knives are worn, they should have changed by the new ones. The second type of the knives crumble the maize material which have been cut before by the first type of the knives. The knives lied on the drums have to be grinded after approximately 20 decars of work. The grinding is made by the grinding stone of the machine while the machine is working in rolanty.

The all parts in Maize chopper as knife disc, cutting disc, drums, take their movement from the shaft. So the machine ensures a good working for long years without giving harm to the tractor with minimum power loss. •This machine takes its movement from the PTO shaft so this provides power of disposal from the tractor drawbar force. •There are 12 cutting knives in the machine. And by the help of cutting arm the cutting height is adjusted to 5mm. •The most important fact of the silage quality is to take care of the knives. They must be sharp enough. The measure between the knives of the machine must be very short to have good results from the silage. By this fact the silage material can be more crumbled and it would be more suitable for making good silage material for the animals. •By the grinding mechanism which is found in the cutting mechanism of the machine makes grinding by stone in a very short time and easy way. The stones and the other parts which will give damage to the machine will be cleaned from the field before the machine starts to work. If not the silage can not give good performance and the knives can be worn in a very short time. To have a good result form silage the machine must be well-adjusted to the ground. The working plane of the machine must be parallel to the soil surface. This can be adjusted by the upper arm of the three point hitch system of the tractor.

Figure 8- Cutting height adjustment unit

Connection of the machine to the tractor:

•Connect the Maize Chopper to the tractor by its three point hitch system.

Dimensions comprising the standard specifications are divided into 4 categories. Fix the upper and bottom security pins by the standards of category II.

Note: Category I includes the tractor max. drawbar power 40 HP.

Category II includes the tractor max.drawbar power 40-100 HP.

This machine produced in the standart specifications of Category II.Table-1 Adjust the upper and lower arm for to make the tractor parallel to the ground. While adjusting this the tractor should be in a flat surface.

Connecting the machine to the tractor:

•Firstly connect the lower non adjustable arm then adjustable arm at the end connect upper connection arm. While disconnecting the machine do the opposite.

ATTENTION!

**STOP THE ENGINE!! THEN ADJUST
AND PREPARE THE MACHINE FOR WORK**

max.

540
min

•Max. Input rotation speed of T-MSM 'is 540 rpm

Category	Max. drawbar power (HP)	Lower hitch pin hole diameter Ø (mm) (max.)-(min)	Upper hitch pin hole diameter Ø (mm) (max.)-(min)
I	...40	22,10-21,84	19,56 - 19,3
II	40-100	28,45-28,19	25,91 - 25,7
III	80-225	36,85-36,32	32,26 - 32
IV	180-400	50,8-49,7	45,5 - 45,2

Table-1.

(Special hitch categories-dimensions associated with implement)

Figure 8- Connection of the machine to the tractor

1-Upper hitch arm

2-Left hanger arm

3- Stretchning chains

4-Lower hitch arm

5-Right hanger arm

**Connecting the pto shaft:**

ES 500X750 and ES 400X850 Pto shafts are used in Maize Chopper.

- Before connecting the pto, clean the surfaces of spindle and lubricate them with grease. Later shift the shaft on the pto spindle until the pin fits into safely. The shifting distance must be at least 15 cm. Take pto shaft guard in a safety position by hanger. This safety position is for the tractor and for the rotation of fixed parts.

- P.T.O shaft can only be connected when the P.T.O connection and engine are switched off and the ignition key is pulled down.

- Connect the prescribed P.T.O. shaft and secure the P.T.O shaft connection by a chain. Make sure that the P.T.O shaft is in proper position on both ends, the adjustment of the P.T.O shaft is necessary for different tractors. To find out the right length. Shorten both shafts and protection tubes for exactly the same length.

To find the right length:

Connect the machine to the tractor.

Pull out the P.T.O shaft entirely and connect each separate half of the shaft to the tractor and compare them with each other.

If the covering of the P.T.O shaft and P.T.O shaft does not run into the block at horizontal position. Transport the machine empty (without fertilizer) to the field. Fill the fertilizer to the tank in the field.

- In transporting position, raise the machine up and lock the security pin to prevent the machine fall down.

- In turnings, take into consideration the load which is outside the centre of gravity and/or constant weight of the implement.

- Working with tractor in the tendency fields can give damage to the machine. But if you have to work in these tendency fields take care of working, do not turn the road bend fastly and sharply. For working in tendency fields you must be careful about if the tractor is decked out with the additional weights. Start the height adjustment of the machine from the ground by the Tractor's hydraulic arm in the position control level. In the position control level, if you move the hydraulic arm slowly the machine rises up, than it stops in a fixed level, then if you give movement to the arm the machine will go up again and then will stop. But the machine does not rises up to the max. upper level as in the drawbar control level.

Note:

If the machine or the implement rises completely up, the front arm is in draw position. If the machine or the implement does not rise up completely it is in position control level. This position control level provides the machine to work on the soil by holding the machine in a specific height. While working with Twin Disc Fertilizer Spreader the position control level must be chosen.

**ATTENTION!**

NEVER TOUCH TO THE MACHINE WITH HAND, etc. WHILE IT IS WORKING.

Easy and safe joint:

The adjustable joint levers and two parking legs are clutching the tractor by three points. The wheel of the machine ensures a significant comfort on the load applied to the tractor.

Operating without chain

All movable parts (blade disc, cutting disc, clutching cylinders) of Türkay slage machines are accelerated directly by the shaft. By this feature, Türkay maize slage machine ensures a good working for long years without giving harm to the tractor with minimum power loss.

Automatically self sharpening cutting discs with drum. Automatically self sharpening two cutting discs made of special steel perform a clean and silent cut even if working at top speed operating condition. Both cutting discs can be replaced easily within a few minutes. The machine has also safety mechanism against overloads.

Feeding unit clutching the maize systems

Two feeding cylinders operating at different levels feed the blade discs safely and rapidly. The whole feeding unit is driven by the gears without any need of maintenance.

Cutting disc with 12 special blades

A stable slage is ensured by means of the special designed cutting mechanism of the machine. The model T-MSMHM has been designed with 12 blades by this purpose. So it is capable to perform the lengths of slage as complete 5 mm by means of its strong cutting lever made of "tungsten carbide"

Figure 10-
*Connection of
the machine to
the tractor*

**Crushing plate**

In order to crush particularly maize pieces completely, a crushing plate can be placed inside the cutting mechanism. The cutting adjustment of the mechanism can be easily adjusted by a bolt.

An easy and rapid self sharpening feature

One of the most significant factors required for the quality and flawless slage is the sharp blades and a distance between the blades and cutting plate that is replaced as possible as narrow. The sharpening process is able to be performed very easy by taking a very short time by means of cutting apparatus significantly replaced inside the cutting mechanism of T-MSMHM Maize Chopper. The cutting range can be easily adjusted centrally.

High blowing capacity, a continues discharge of the slage machine

By means of the strong blade disc and disc vanes of Turkey slage machine, the slage maize is loaded rapidly on to the romork with the loading chamber. Upon request, it is possible to operate the discharging chimney protrusion in paralel to cutting and carriage tractors.

Remote control of discharging chimney-crop chute

The discharging chimney of T-MSMHM model slage machine with gearbox can be adjust by a remote control without any need of operator's effort. The remote control system may be placed next to the tractor driver and even inside the cabin of the tractor.

Easy and safe joint:

The adjustable joint levers and two parking legs are clutching the tractor by three points. The wheel of the machine ensures a significant comfort on the load applied to the tractor.

Operating without chain

All movable parts (blade disc, cutting disc, clutching cylinders) of Turkey slage machines are accelerated directly by the shaft. By this feature, Turkey maize slage machine ensures a good working for long years without giving harm to the tractor with minimum power loss.

Automatically self sharpening cutting discs with drum

Automatically self sharpening two cutting discs made of special steel perform a clean and silent cut even if working at top speed operating condition. Both cutting discs can be replaced easily within a few minutes. The machine has also safety mechanism against overloads.

Feeding unit clutching the maize systems

Two feeding cylinders operating at different levels feed the blade discs safely and rapidly. The whole feeding unit is driven by the gears without any need of maintenance.

Cutting disc with 12 special blades

A stable slage is ensured by means of the special designed cutting mechanism of the machine. The model TMSMHM has been designed with 12 blades by this purpose. So it is capable to perform the lengths of slage as complete 5 mm by means of its strong cutting lever made of "tungsten carbide"

Crushing plate

In order to crush particularly maize pieces completely, a crushing plate can be placed inside the cutting mechanism. The cutting adjustment of the mechanism can be easily adjusted by a bolt.

An easy and rapid self sharpening feature

One of the most significant factors required for the quality and flawless slage is the sharp blades and a distance between the blades and cutting plate that is replaced as possible as narrow. The sharpening process is able to be performed very easy by taking a very short time by means of cutting apparatus significantly replaced inside the cutting mechanism of T-MSMHM Maize Chopper. The cutting range can be easily adjusted centrally.

High blowing capacity, a continues discharge of the slage machine

By means of the strong blade disc and disc vanes of Minos slage machine, the slage maize is loaded rapidly on to the romork with the loading chamber. Upon request, it is possible to operate the discharging chimney protrusion in paralel to cutting and carriage tractors.

Remote control of discharging chimney-crop chute

The discharging chimney of T-MSMHM model slage machine with gearbox can be adjust by a remote control without any need of operator's effort. The remote control system may be placed next to the tractor driver and even inside the cabin of the tractor.

**Take care about the items that is written below for maintenance and repair :**

- Cleaning, lubrication or adjusting of the implement, driven by the P.T.O shaft can be done when the connection and the engine are switched off and the ignition key is pulled out.
- Maintenance and repair must be done after the shaft and machine is disconnected from the tractor.
- Put the machine in a closed area after work, lubricate the parts and take care against rust.
- Control the nuts and screws every day to see if they are tightened enough. If not tighten them.
- Change the broken and worn parts.
- Choose the suitable parts while making maintenance. The parts must be safety.
- Use adequate tools and gloves during repairs, maintenance and cleaning.
- Lubricate the grease nipples everyday periodically.
- Control the gear box oil level in each 30 hours of work. Change the oil of the gear box after controlling the oil level in the period of 300 hours work. Use SAE 140 oil in the gear box.
- If you perform any maintenance on the lifted implement, always secure the implement by a suitable holder.
- While cleaning the machine use high pressured water. But take care of the bearings, felts.
- For high working quality and working safety change worn knives on the cutting disc.
- Control screws and nuts of the knives connection parts periodically. Control the holes of connection part of the knives. If they are worn change them.

- Call Turkey technical service for the maintenance of the machine. (Table.2)
- The balance problems of the knives causes vibrations on the machine. So this vibrations cause big damage. While working if there is increasing in the vibrations and if the working knives make noise, stop the machine, look for the damage and try to repair it then start to work.

Grinding and changing the knives:

- The changing of the knives must be done by technical and professional people. Because this avoids the danger of losing of the knives and flying them out.

Grinding the knives:

Firstly open the cover lid of the grinding stone. Turn the grinding stone right by the help of the bolt. While grinding take care that the grinding stone is turning right. Do not forget to make the grinding while the machine is in rotary position.

How will you understand that the knives need grinding?

If the maize pieces are big and thick after harvesting, this means the knives of the machine need grinding.

Taking out of the knives of the machine:

- Firstly disconnect the shaft and machine from the tractor.

- With the help of the lifting mechanism by turning the machine, hold the machine and take out of the knives easily.

- Take out the connection screw and nuts of the knives by an adequate tool.

Putting on the knives:

- Connect the knives in a regular line.
- Connect the knives by their connecting screws and nuts.
- Tighten the security nut well and be sure that it is tightened enough.

Figure 11- Grinding stone

**ATTENTION!**

IN EACH PERIOD OF CHANGING THE KNIFE
USE A NEW SECURITY NUT

**ATTENTION!**

MAINTENANCE, REPAIRS, CLEANING MAY
ONLY BE EXECUTED WHEN THE DRIVE AND
THE ENGINE ARE SWITCHED OFF AND THE
IGNITION KEY IS PULLED OUT.

CONTROL(A)	MAINTENANCE(B)		VARIATION(C)		
Maintenance Period ==>	Daily	Weekly	30 Hours	100 Hours	400 Hours
Lubrication (Level control of gear box oil) Variation of oil(SAE140)			C		C
Oil leakage control	A				
Wearing control of knife holders, knife connection holes, the flanges of knife holders		A			
Lub.grease nipples		B			
Tightness control (bolt-nut)	A		C		
Cleaning	B				

Table.2- Maintenance Periods

**Safety decals:**

There are 3 types of main safety decals. These are shown as,

Danger :

When you see this alert symbol and heading be alert to the danger of injury or death of men and animals.

Alert :

When you see this heading, be alert to the possibility of serious injuries because of using the machine out of the using rules.

Attention :

When you see this heading, be alert to the possibility of damage to equipment, crop, building, etc. but to financial and/or juridical problems as well.

- All machines have stickers glued on. In this stickers machine type, address of manufacturer, machine serial number, model of the machine is prescribed.

Figure 12- Alert Decals

**ATTENTION!**

**READ OPERATORS MANUAL BEFORE
STARTING TO WORK WITH THE MACHINE.**

1- Operators Manual.

2- Never stay behind the tractor.

3- Never be in the working area of the machine.

4- Never touch to the machine while working.

5- Do not open or remove safety shields while the engine is running.

6- Never be between the machine and tractor.

7- Never touch the rotating parts of the machine.

 	• Besides the instructions from this readers manual take into consideration all generally used safety and accident regulations.
--	---

 	• Stay away from slewing and unfolding area of the machine, this because of the danger of squeezing.
--	--

 	• It is prohibited to touch the machine until all parts are standing still
--	--

 	• Danger of injury. Keep a safe distance from the machine.
--	--

 	• When the machine is operating there is a possibility of amputation of limbs. It is prohibited to be in the danger area when there is danger of amputation.
--	--

 	• Keep distance, objects(stones and other debris) can be flung away at very high speed.
--	---

 	• Stop the engine and ensure it cannot be re-started during performance of work on the machine.
--	---

- Make sure all operators are provided with the instruction manual and are aware of the risks and the safe operating procedures. They should particularly be aware of the safe use of the machinery, clearing blockages and the recommended procedure for grinding the knives of the machine.

- Hazards are as follows take care about them:

- The exposed cutterhead while sharpening.

- The moving drive mechanisms.

- Guards fouling the rotating cutterhead.

- The grinding stone being ejected or breaking up while grinding.

- Noise and vibration

- When grinding knives on trailed machines, do not lean over the grinding mechanism.

- Wear safety clothes, safety goggles when sharpening.

- Use mechanical handlers or handling aids when placing full additive containers onto the forager. It may be easier to top up the forager-mounted container from a bulk tank using a transfer pump.

- Take care when working on steep ground.

- This is particularly important when using a trailed forager with a towed trailer;

- Expose the knives for any reason (eg grinding) unless the cutterhead has stopped rotating;

- Attempt to open or close the cutterhead guards unless the cutterhead has stopped rotating;

- When blowing grass into a separately towed trailer consider the other driver and avoid sudden manoeuvres.

- Safety and warning decals, placed on the machine, give important instructions for safe work. Take them into consideration for your safety.

- Make sure you get familiar with all devices and elements for handling and with the functions before starting with the work.

- Avoid wearing loose-fitting clothes. Clothes should fit tight to the operator's body.

- Implements should be connected according to the instructions fastened to the prescribed devices and secured.

- Never left the driving seat during driving.

- Strating devices for remote control should be secured in a way that, they can not be unintentionally released during transport or work.

- When disconnecting the machine from the tractor, place it on the flat ground.

- Never jump, sit or climb on the machine while it is connected to the tractor.

- Stopping or operating the machine must be done by the driver. No one may drive the tractor except the driver.

- Use protection for hearing and glasses while working with the machine if the tractor does not have a closed cabin.

- Never give maize crop to the feeding unit of the machine and never touch the machine by hand or feet, while the machine is working.

- Work with a technical and professional operators while working with Maize Chopper with an additional apparatus or machine.

10	1	T-MSMHM -1.2.1.5	Washer	Ø34x13x5
11	1	SOMFIB-AKS-M12x1,75	hex. Nut	SOMFIB-AKS-M12x1,75 DIN 934
12	1	T-MSMHM -1.2.1.9	wheel assy	

7.8 Support Wheel / T-MSMHH-1.2

SPARE PARTS LIST

7.9 Knife Sharpener / T-MSMHH-1.3.16

Pos Number	Quantity	Order Number	Explanation	Norm (DIN)
01	1	T-MSMHM -1.3.16	Knife sharpener as	
02	1	T-MSMHM -1.3.16.1	Bearing	
03	1	T-MSMHM -1.3.16.7	Hub	
04	1	T-MSMHM -1.3.16.12	Grinding wheel	Ø284x127x15
05	4	T-MSMHM -1.3.16.13	bolt,hex-hd	M10x1.5x20 DIN 931
05	4	SOMFIB-AKS-M10x1,5	hex, nut	SOMFIB-AKS-M10x1,5 DIN 934
06	1	T-MSMHM -1.3.16.2	Shaft	
07	2	RUL-6005 2RS NIS	Bearing	RUL-6005 2RS NIS
08	1	SAP-M12x1.75x140	pin, threaded	M12x1.75x140
09	1	CIV-M8x1,25x15-8.8	Bolt	CIV-M8x1,25x15-8.8 DIN 931
10	1	T-MSMHM -1.3.16.10	Washer	Ø9x38x2
11	1	TUT-PLAS-M12x1.75	star grip	M12x1.75
12	1	T-MSMHM -1.3.16.4	pressure spring	
13	3	SOMFIB-AKS-M10x1,5	hex, nut	SOMFIB-AKS-M10x1,5 DIN 934
13	3	RON-DUZ-M10	Washer	RON-DUZ-M10
14	1	T-MSMHM -1.4.7	Washer	
15	1	GRE-DÜZ-M8	Grease fitting	GRE-DÜZ-M8

7.9 Knife Sharpener - T-MSMHH-1.3.16

**SPARE PARTS LIST**

7.10 Oil Tank Group- T-MSMHH-1.3.327.10

Pos No	Quantity	Order Number	Explanation	Norm (DIN)
